

# Procedure:

## How To Make Bubble Hash

Follow this procedure to make bubble hash.

---

**1**

Freeze the prepared cannabis for one hour or longer. The plants should have a temperature of 41°F (35°C) or lower at the beginning of the extraction.

**2**

Place the plant material in a bucket or large trash container. You can also place it in an ice-water extraction machine.

**3**

Add water and a lot of ice. You can use regular ice or dry ice.

**4**

Wait a few minutes for the water to get cold. When the temperature gets below 34°F (1°C), the trichomes will break off the plant more easily.

**5**

Using a wooden spoon, stir the material for a few minutes so the trichomes break away from the plant material. If you're using a machine, simply turn it on and let it do the mixing for you.

**6**

Set up micron filters, such as bubble bags, Ice-o-lator bags, Essential Extracts bags, or EZ Strainers. Place the filters in or over a separate container in numerical order with the largest number (220 microns) on top/inside and the smallest on the bottom/outside.

**7**

Pour the cold, agitated contents of the bucket into the innermost bag/filter. It will flow through the outer bags and into the container.

**8**

Wearing gloves, pull out the innermost (220 micron) bag and squeeze the excess water into the bag underneath it. Discard the contents of this bag or use alcohol to extract any remaining essential oils.

**9**

Pull out the second bag and squeeze the excess water into the bag underneath it.

**10**

Scrape the resin from the bottom of the bag/filter and lay it out on parchment paper in a thin layer to dry. Dry for at least 48 hours before use.

**11**

Repeat for the remaining bags/filters.
